Product Description

Bentos is a handmade silicone that mimics an octopus fossil that is so common on our shores. It has many distinctive characteristics. On the one hand, its structure is based on a thick body to mimic the body of cephalopods, which results in six legs of different lengths and different curls to create a greater richness of movement. These legs are the ones that provide mobility at the slightest movement. On the other hand, they are the eyes, to give realism and locate a greater percentage of attacks in that area of , more durable than the legs and close to the area where the hook is. A common prey for fish on our shores and with action in abundance, bites are guaranteed. Both large fish such as bass, and biting fish such as bream and surfperch ... The package contains 8 bags USE TIPS It accepts a wide range of mollies, since the movement is done by the tentacles. It can be rigged with any jighead of choice, although we highly recommend using cheburashkas that come with a hook. The hook should come out between the eyes of the silicone .
